

Figure 1: Comparison of the two methods. The left panel shows the results of the first method, and the right panel shows the results of the second method.

The results of the first method are shown in the left panel, and the results of the second method are shown in the right panel.

The first method is based on the following assumptions:

1. The data is normally distributed.

2. The variance is constant across all groups.

3. The groups are independent of each other.

The second method is based on the following assumptions:

1. The data is normally distributed.

2. The variance is proportional to the mean.
