1. **Introduction**

The purpose of this study is to investigate the effects of a new educational program on student performance. The program is designed to improve critical thinking and problem-solving skills through a series of interactive activities and projects. The study will evaluate the program's effectiveness by comparing the performance of students who participated in the program with those who did not. The data will be analyzed using statistical methods to determine if there are significant differences in performance between the two groups.

The study is organized as follows. Chapter 2 provides a literature review of the existing research on educational programs and their effects on student performance. Chapter 3 describes the methodology used in the study, including the selection of participants, the design of the program, and the data collection process. Chapter 4 presents the results of the study, and Chapter 5 discusses the implications of the findings for future research and practice.

2. Literature Review

There is a growing body of research on the effectiveness of educational programs. Many studies have shown that programs that focus on developing critical thinking and problem-solving skills can lead to improved student performance. For example, a study by Smith and Jones (2018) found that students who participated in a program designed to improve their critical thinking skills showed significantly higher scores on standardized tests compared to those who did not. Similarly, a study by Brown and White (2019) found that students who participated in a program that emphasized problem-solving skills showed higher levels of engagement and achievement in their coursework. These findings suggest that educational programs that focus on developing these skills can have a positive impact on student performance. However, more research is needed to understand the specific mechanisms through which these programs work and to identify the factors that influence their effectiveness.
