the 1990s, the number of people with a diagnosis of schizophrenia has increased in many countries.

There is a growing awareness of the need to improve the lives of people with schizophrenia. This has led to a focus on the development of psychosocial interventions, which aim to help people with schizophrenia to live more independently and to participate more fully in society. One of the most widely used psychosocial interventions is cognitive remediation, which aims to improve the cognitive skills of people with schizophrenia, such as memory, attention, and problem-solving.

There is a growing body of evidence that cognitive remediation can improve the cognitive skills of people with schizophrenia, and this has led to an increase in the use of this intervention.

One of the most widely used cognitive remediation interventions is the *Rehabilitation of Cognitive Function (RCF)* program.

The *RCF* program is a computerized program that aims to improve the cognitive skills of people with schizophrenia.

The program consists of a series of exercises that are designed to improve memory, attention, and problem-solving skills.

The program is designed to be used by people with schizophrenia who are in the early stages of their illness.
