1. **Introduction**

The purpose of this study is to investigate the effects of a new educational program on student learning outcomes. The program is designed to enhance critical thinking and problem-solving skills through a series of interactive modules.

2. **Methodology**

The study employed a quasi-experimental design, comparing the performance of students who participated in the program (the experimental group) against those who did not (the control group). Data was collected through standardized tests and surveys.

3. **Results and Discussion**

The results of the study indicate a significant positive impact of the program on the experimental group. Students who completed the program showed a marked increase in their scores on critical thinking and problem-solving tests compared to the control group. This suggests that the program's interactive and module-based approach is effective in fostering these essential skills. The data also shows that the control group's performance remained relatively stable throughout the study period.

4. **Conclusion**

In conclusion, the findings of this study support the implementation of the new educational program. The program's focus on interactive learning and modules appears to be a successful strategy for improving student learning outcomes, particularly in the areas of critical thinking and problem-solving. Further research is needed to explore the long-term effects of the program and its applicability to other educational contexts.
