1. **Introduction**

2. **Methodology**

The study was conducted in a laboratory setting. The participants were recruited from a local university and were assigned to two groups: the control group and the experimental group. The control group consisted of 15 individuals, and the experimental group consisted of 15 individuals. The experimental group received a specific intervention over a period of 8 weeks. The control group did not receive any intervention. The data was collected through a series of tests and questionnaires. The results were analyzed using statistical methods. The findings indicate that the experimental group showed significant improvement in the measured variables compared to the control group. The improvement was statistically significant at the 0.05 level. The results suggest that the intervention is effective in improving the measured variables. The study has several limitations, including a small sample size and a short duration. Further research is needed to confirm the findings and to explore the long-term effects of the intervention.
