Abstract
Keywords

The purpose of this study is to investigate the effects of the independent variable on the dependent variable. The study was conducted using a quantitative research design. The data was collected through a survey of 100 participants. The results show a significant positive correlation between the independent variable and the dependent variable. This finding is consistent with previous research in the field. The study has several limitations, including a small sample size and a cross-sectional design. Future research should explore these issues further.
