

1. **Introduction**

The purpose of this study is to investigate the effects of the proposed system on the performance of the participants. The study was conducted in a laboratory setting and involved a group of 20 participants.

The participants were divided into two groups: a control group and an experimental group. The control group used the traditional method, while the experimental group used the proposed system. The performance of the participants was measured using a series of tasks.

The results of the study show that the proposed system significantly improved the performance of the participants in the experimental group compared to the control group. This improvement was observed across all tasks.

The proposed system was found to be more efficient and effective than the traditional method. The participants in the experimental group completed the tasks faster and with fewer errors.

The study also found that the proposed system was more user-friendly and easier to learn than the traditional method. The participants in the experimental group reported higher satisfaction and confidence in using the system.

In conclusion, the proposed system is a promising tool for improving the performance of participants in the laboratory setting. Further research is needed to evaluate the system in a real-world setting.
