1. **Introduction**

The purpose of this study is to investigate the effects of a new educational program on student learning outcomes.

The study was conducted over a period of six months, involving a sample of 100 students from a university. The data was collected through a series of tests and surveys, and the results were analyzed using statistical methods.

The findings of the study indicate that the new program had a significant positive impact on student learning outcomes.

2. Methodology

The study used a quasi-experimental design, comparing the performance of students who participated in the new program (the experimental group) with those who did not (the control group). The experimental group was selected through a random sampling process, and the control group was selected from the same pool of students. The data was collected through a series of tests and surveys, and the results were analyzed using statistical methods.

The results of the study are presented in the following table:

The table shows that the experimental group performed significantly better than the control group on all measures of learning outcomes.

The results of the study suggest that the new program is an effective way to improve student learning outcomes. The program should be implemented on a larger scale to reach more students.
