

1. **Introduction**

The purpose of this study is to investigate the effects of the proposed system on the performance of the participants. The study was conducted in a laboratory setting and involved a group of 20 participants.

2. **Methodology**

The study was conducted in a laboratory setting and involved a group of 20 participants. The participants were divided into two groups: a control group and an experimental group. The control group used the traditional method, while the experimental group used the proposed system.

The participants were trained for two weeks before the experiment. The experiment was conducted over a period of four weeks. The participants were asked to perform a series of tasks that required the use of the proposed system. The tasks were designed to be challenging and to require the use of the proposed system.

3. **Results**

The results of the study showed that the proposed system significantly improved the performance of the participants. The experimental group performed better than the control group in all tasks.

4. **Conclusion**

The proposed system is a promising tool for improving the performance of participants. The system is easy to use and requires minimal training. The system is also cost-effective and can be used in a variety of settings.
