

Fig. 1 Relationship between the number of fish and the number of fish per 100 m³ in the water column. The number of fish per 100 m³ was calculated from the number of fish in the water column and the volume of the water column. The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column

the number of fish in the water column and the number of fish per 100 m³ in the water column. The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column.

The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column. The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column.

The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column. The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column.

The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column. The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column.

The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column. The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column.

The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column. The number of fish in the water column was calculated from the number of fish in the water column and the number of fish per 100 m³ in the water column.
